**MILLSTREAM INTERSECTS MASSIVE AND STRINGER SULPHIDES
IN DRILL HOLE S-07-08**

Toronto, Ontario, Millstream Mines Ltd. (MLM-TSX-V; NJD- Frankfurt) is pleased to report that its on-going diamond drill program at its Potter property continues to intersect massive and stringer sulphides in drill hole S-07-08. A downhole 26 metre (85.3 ft.) core interval in S-07-08 intersected massive and stringer sulphides.

Core samples have been prepared and delivered to Swastika Laboratory in Swastika, Ontario for assaying. Assay results upon being received will be reviewed by management with the consultants and then reported to the public.

Additionally, some warrants have been exercised by investors for a total of 906,500 shares with an aggregate value of \$ 209,195.

Millstream continues drilling to further explore this potentially rich volcanogenic massive sulphide (VMS) type deposit at its Potter Property. The past producing property is host to copper-zinc-cobalt "stacked" mineralized zones located in the highly prolific Abitibi Greenstone Belt in the Kidd-Munro Assemblage near the town of Matheson in north eastern Ontario, Canada. It is the company's ambition to fulfill drilling requirements necessary to estimate a NI 43-101 compliant resource.

Dave Gamble, P.Geo. and Edward Bettiol, P. Eng, both consultant geologists of Millstream, are the Qualified Persons as described in National Instrument 43-101 for the Potter Mine Project. They have reviewed this report and press release with company management.

The principle objective of Millstream Mines Ltd. is to enhance and develop known mineral properties to production potential.

Millstream seeks safe harbour with regards to forward looking statements.
